Submitted (13-MY-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On May 13, 2003 this sequence version replaced gi:24942321.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bom.lwo.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 5 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Submitted (06-007-2001) Sanger Centre, Hinxton, Cambridgeshire, Calo 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerques@sanger.ac.uk
On Oct 9, 2001 this sequence version replaced gi:15858875.
During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above. This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality) as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by resolve all sequencing problems, such abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSROCT; Tr:, TREMBL; Wp:, MORMPEP; Information on the WORMPEP that of the content of the content
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         http://www.anger.ac.uk/Projects/C_elegans/wormpep This sequence http://www.anger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 1, constructed by the Sanger Centre Chromosome 1 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr1 RPS-1091G18 is from the library RPCI-S constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm WCTOR: porPACZ IMPORTANT: This sequence is not the entire insert of clone RPS-1091G18 it may be shorter because we sequence overlapping sections only once, except for a short overlap. The true left end of clone RPS-936N10 is at 41552 in this sequence. The true right end of clone RPS-936N10 is at 2000 in this sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    23397 IGATACTATICTAGGAACCACAGATITAGCAGIGAATAAGACGIGCTITCAIGGCAATIT 23456

CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone

requeets: clonerequest@sanger.ac.uk

On Mar 31, 2000 this sequence version replaced gi:7327706.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations

together with a note of the overlapping clone name. Note that the

variation annotation may not be found in the sequence submission

corresponding to the overlapping clone, as we submit sequences with

only a small overlap as described above.

The following abbreviations are used to associate primary accession

numbers given in the feature table with their source databases:

EMI; Sw., SWISSPROT; Tr., TREMBL; WP:, WORMPEP; Information

on the WORMBEP database can be found at

http://www.sanger.ac.uk/Projects/C elegans/wormpep This sequence

was generated from part of bacterial clone contigs of human

chromosome 20, constructed by the Sanger Centre Chromosome 20

Mapping Group. Further information can be found at

http://www.sanger.ac.uk/HGP/Chr20

IMPORTANT: This sequence is not the entire insert of clone RP11-3X6

It may be shorter because we sequence overlapping sections only

once, except for a 100 base overlap.

The true left end of clone RP11-97N19 is at 116242 in this

sequence. The true right end of clone RP5-1068E13 is at 100 in this

sequence. The true right end of clone RP5-1068E13 is at 100 in this

sequence. The true right end of clone RP5-1068E13 is at 100 in this

sequence. The true right end of clone RP5-1068E13 is at 100 in this

sequence. The true right end of clone RP5-1068E13 is at 100 in this

sequence. The true right end of clone RP5-1068E13 is at 100 in this

sequence. The true right end of clone RP5-1068E13 is at 100 in this

sequence. The true right end of clone RP5-1068E13 is at 100 in this

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                  NOTE: This is a 'working draft' sequence. It currently consists of 15 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  contig of 2297 bp in length

```
Uniting sequence assembly data is compared to vertagoing by the differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em: SMBL; Sw: SWISSPROT; Tr:, TREMBL; Wp:, WORNPEP; Information on the WORNPEP database can be found at http://www.sanger.ac.uk/Projects/C elegans/wormpep Clone-derived zebrafish pUC subclones occasionally display inconsistency over the length of monouncleotide A/T runs and conserved TA repeats. Where this is found the longest good quality representation will be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          90735 AITTIAATCTTGTAGAAGAATCATTTTTATCAGTGTTTCAGAAATTATATTTGGATATTA 90794

NOTE: Betimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft" sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                3 TGCTAATACTGTAGGAGTTTCAATTTCAGCAGGGTATCAGAACGGCTTTACTGGTAATAT 62

On May 13, 2003 this sequence version replaced gi:23264150.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NOTE: Bstimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Center Clone name: CH230-66P3

Submitted (13-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA ON NOV 13, 2002 this sequence version replaced gi:22857243.

The sequence in this assembly is a combination of BAC based reads and whole genome shockyun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NOTE: Bstimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank draft data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

An ScW gene promoter may be used to express proteins and RNA transcripts in transgenic plants. The promoter is operably linked to the desired nucleotide sequence and the recombinant but is introduced into plant cells. The method is useful for producing plants having unique signature sequences or other marker sequences which can be used to identify proprietary lines or varieties. Transgenic plants may be created for use in traditional agriculture and for use in the manufacture of proteins or other compounds, which are extracted or purified from plant parts or seeds. They may also be used in commercial
(SCBV) promoter (including a biologically active subunit). Fertile transgenic plants produced by transformation with the DNA sequence are useful for conventional plant breeding programs. Other transgenic plants are useful for generating beneficial agronomic characteristics, including resistance to water deficit, pest resistance, herbicide resistance, increased yield, improved nutritional content, and improved processing characteristics. They are also useful for commercial protein manufacture. The SCBV promoter is a strong, constitutive promoter in may cells, enabling the expression of genes in fertile transgenic monocot or dicot plants, which allows genetic engineering of improved plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sugarcane bacilliform virus; ScBV; ScBV promoter; transgenic plant; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Newly isolated DNA molecule comprising a sugarcane bacilliform virus promoter - useful for generating fertile transgenic plants with beneficial agronomic characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 7568 BP; 2602 A; 1472 C; 1805 G; 1689 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides sugarcane bacilliform virus (SCBV) promoters selected from sequences shown in AAZ39511-513. The promoter is used to express proteins and RNA transcripts in transgenic plants in order to improve their characteristics. The promoter confers constitutively high levels of expression of operably linked preselected DNA sequences in both monocot and dicot plants, plant tissue, plant parts or plant cells. The present sequence represents the sugarcane bacilliform virus gene sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Newly isolated DNA molecule comprising a sugarcane bacilliform virus promoter - useful for generating fertile transgenic plants with beneficial agronomic characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to an isolated and purified DNA molecule, which comprises a promoter (appearing as ABX93829, Promoter 1) or its fragment with promoter activity, where the DNA molecule does not encode a sugarcane bacilliform virus (ScBv) polypeptide. Also included is an expression cassette comprising a first DNA segment, which comprise Promoterl or its fragment with promoter activity, functional in a plant cell poperably linked to a second DNA segment encoding a protein or RNA transcript, where the second DNA segment encoding a protein or RNA transcript, where the second DNA segment does not encode a sugarcane bacilliform virus polypeptide. The DNA or promoter is useful for expressing proteins and/or RNA transcripts in transgenic plants, or for conferring constitutively high levels of expression of operably linked preselected DNA segments in both monocotyledonous and dicotyledonous plants, plant tissue, plant parts or plant cells. The DNA or promoter is particularly useful in plant genetic engineering to obtain fertile transgenic plants (e.g. oat, wheat, soybean, corn, tobacco, rice, barley, potato, tomato, lettuce, oilseed rape, cotton, flax, sugar beet, sorghum, characteristics or traits, e.g. increased stress tolerance, pest resistance (eig. bacteria, viruses or fungi), improved yielde, improved yielde, improved yielde, improved yielde, improved yielde, improved or increased to mand to the protein or increased to mand the constant cannot or improved yielde, improved yielde, improved yielde, improved yielde.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New sugarcane bacilliform virus promoters, useful for obtaining transgenic plants (e.g. oat) with improved properties, e.g. increased stress tolerance, pest or disease resistance, improved yields or improved

```
The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-cancerus) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the encoded by the markers, antibodies that selectively bind to the corresponding to a marker of the invention and a method of treating a corresponding to a marker of the invention and a method of treating a corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer comprising providing to cells of the patient antisense oligonuclectide complementary to a marker of the invention. The markers comparing the level of expression of a marker in a patient sample and a normal level of expression of the capression levels indicates ovarian cancer. The level of expression of a marker in a control non-ovarian cancer. The level of expression of a capression levels indicates ovarian cancer. The level of expression of a capression levels indicates ovarian cancer. The level of expression of a capression of the marker corresponds to a secreted protein or to a transcribed capted or its portion. The level of expression of the marker is assessed by detecting the presence of protein or protein or protein fragment is detected using an antibody that specifically binds with the corresponding the presence of a transcribed corresponding to the marker or anneals with a portion of the marker is also used for monitoring the presence of a transcribed corresponding the presence of a transcribed corrected encompassing the marker, under stringent conditions. The patient which involves detecting expression of the marker in a patient capter which involves detecting expression of the marker in a patient condition at a first point in time, repeating the method at a subsequent crime and compassing the level of expression of or transcribed out time and compassing the level of expression conditions or patient which involves detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                      Human; ovarian cancer; ds; tumour; cytostatic; DNA marker.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. noncovarian cancer cells as compared to their expression in normal (i.e. noncomposed by the markers, antibodies that selectively bind to the cancerous) ovarian cancer involving that selectively bind to the corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer comprising providing to cells of the patient afflicted with ovarian cancer comprising providing to cells of the patient antisense oligonucleotide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of the marker in a control non-ovarian cancer sample. A difference between the expression levels indicates ovarian cancer. The level of expression of a marker corresponds to a secreted protein or to a transcribed protein or protein c fragment corresponding to the marker. The presence of protein or protein c fragment is detected using an antibody that specifically binds with the protein or protein of protein or protein or protein of the marker.
                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.

the marker is assessed by detecting the presence of a transcribed polynucleotide which anneals with the marker or anneals with a portion of the polynucleotide comprising the marker or anneals with a portion of perpension polynucleotide comprising the marker, under stringent conditions. The marker is also used for monitoring the progression of the marker in a patient which involves detecting expression of the marker in a patient sample at a first point in time, repeating the method at a subsequent time and comparing the level of expression. The method at a subsequent using an ovariant issue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DAA marker of the invention. Note: The sequence data for this patent did not form part from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; berbicide; osmosis; pathogen tolerance; pest telerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polymucleotide; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant with the polynucleotide or polypeptide is useful for producing plants with improved plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to herbicides, extreme osmotic conditions, pathogens or peets, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of condons recombination, modified seed oil or protein yield and/or content, improved plant growth and development under at least on stress providing improved plant growth and development under at least on stress condition, improved lignin production or improved galactomannan condition. Note: The sequence data for this patent did condition part of the printed specification but was obtained in electronic condition at least on sequence them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to heterologous genes comprising non-plant 3'-termination sequences and plant expression cassettes incorporating the heterologus genes. The invention is useful for gene expression in plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New recombinant expression cassette comprising a promoter that is functional in plants, operably linked with a coding sequence and a non-plant 3' termination sequence, useful for gene expression in plant cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Heterologous gene; expression cassette; gene expression; yeast; CHS5;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotides of nontypeable strain of Haemophilus influenzae, useful for treating or preventing NTHi bacterial infections of the middle ear and/or nasopharynx.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises nucleotide sequences (genes) from the genome of
cells. The present sequence is yeast CHS5 (CAL3) gene. This sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nontypeable strain of Haemophilus influenzae (WTHi). The NTHi DNA sequences of the invention are useful for treating or preventing NTHi bacterial infections of the middle ear and/or nasopharynx. The present nucleic acid represents an NTHi contig sequence of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises a method of screening an agonist of invertebrate animal potential dependent calcium channel. The method involves spear squid potential-dependent calcium channel alpha 1 subunit (LoCav2), potential-dependent calcium-channel beta subunit, and mammal myogenic potential-dependent calcium-channel alpha-1/delta subunit. The method of the invention is useful for screening an agonist of invertebrate animal potential-dependent calcium channel, and contributes in research of an insect repellent such as a pesticide. The present DNA sequence encodes a squid protein that was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; transporter protein; immune response; pharmacogenomic analysis; drug screening; gene therapy; single nucleotide polymorphism; SNP; immunostimulant; chromosome 18; gene; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises nucleotide sequences (genes) from the genome of nontypeable strain of Haemophilus influenzae (NTH1). The NTH1 DNA sequences of the invention are useful for treating or preventing NTH1 bacterial infections of the middle ear and/or nasopharynx. The present nucleic acid represents an NTH1 DNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 135356 BP; 41426 A; 24873 C; 27795 G; 41257 T; 0 U; 5 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to novel human transporter proteins and nucleic acids encoding them. Sequences of the invention are useful as query sequences. In database searches to identify other family members or related sequences. The proteins may be used to raise antibodies or to elicit immune responses, in drug screening assays, as reagents in assays designed to quantitatively determine levels of the protein in biological fluids, as markers for tissues in which the corresponding protein is preferentially expressed, in cell-based or cell-free systems, to identify modulators of protein activity, as targets for diagnosing a disease or predisposition to a disease mediated by the peptide, in pharmacogenomic analysis, and to treat disorders characterised by inappropriate or useful in detecting mutations in transporter genes and gene expression constructs for controlling transporter gene sypression constructs for controlling transporter gene therapy of patients with cells that are aberrant in transporter gene expression. The present sequence is human transporter genomic DNA which is located on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                   This invention relates to a novel method for predicting gene potential by associating nucleic acid sequences of unknown function with particular sub-population profiles. Specifically, it refers to classifying an unknown multi-lineage affiliated gene by collecting hybridisation data to develop a gene expression map, in order to determine the discrete sub-compoundation where it is expressed. The present invention describes methods for predicting the lineage commitment of genes associated with the self-crenewing haematopoietic (blood) stem cells (HSCs), as well as the non-self renewing multipotent progenitors (CMPs), which are collectively referred to as bone marrow stem cells populations. As such, these methods can be used to identify associated multi-lineage affiliated genes and hence the underlying molecular mechanisms in physiological haematopoietic development. This polynucleotide sequence is DNA associated with a murine come sub population of cells of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a novel method for predicting gene potential by associating nucleic acid sequences of unknown function with particular sub-population profiles. Specifically, it refers to classifying an unknown multi-lineage affiliated gene by collecting hybridisation data to develop a gene expression map, in order to determine the discrete sub-population where it is expressed. The present invention describes methods for predicting the lineage commitment of genes associated with the self-renewing haematopoietic (blood) stem cells (HSCs), as well as the non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       gene potential; multi-lineage; cell commitment; haematopoietic stem cell; HSC; multipotent progenitor; MPP; common lymphoid progenitor; CLP; common myeloid progenitor; CMP; bone marrow stem cell; mouse; murine; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Classifying an unknown multi-lineage affiliated gene comprises isolating expressed nucleic acid sequences from the discrete cell sub-populations.

Specifically, it refers to classifying an unknown multi-lineage affiliated gene by collecting hybridisation data to develop a gene expression map, in order to determine the discrete subpopulation where it is expressed. The present invention describes methods for predicting the lineage commitment of genes associated with the self-renewing haematopoietic (blood) stem cells (HSCS), as well as the non-referred to as bone marrow stem cells (CMPS), which are collectively referred to as bone marrow stem cells populations. As such, these methods can be used to identify associated multi-lineage affiliated genes and hence the underlying molecular mechanisms in physiological haematopoietic development. This polynucleotide sequence is DNA associated with a murine
self renewing multipotent progenitors (MPPs), common lymphoid progenitors (CLPs) and common myeloid progenitors (CMPs), which are collectively referred to as bone marrow stem cells populations. As such, these methods can be used to identify associated multi-lineage affiliated genes and hence the underlying molecular mechanisms in physiological haematopoietic development. This polynucleotide sequence is DNA associated with a murine CMP sub population of cells of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     gene potential; multi-lineage; cell commitment; haematopoietic stem cell; HSC; multipotent progenitor; MPP; common lymphoid progenitor; CLP; common myeloid progenitor; CMP; bone marrow stem cell; mouse; murine; ds.

New nucleic acid comprising a sequence encoding an Enterococcus fecalis polypeptide, useful for preparing a composition for diagnosing or treating E. fecalis infection.

Disclosure; SEQ ID NO 1231; 193pp; English.

The invention relates to Enterococcus faecalis polynucleotides and polypeptides. The invention also relates to a recombinant expression vector comprising a polynucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for producing an B. faecalis polypebtide, an isolated nucleic acid comprising a sequence not given in the specification, a recombinant vector

Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense encoding a polypeptide whose expression is inhibited by the antisense polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting callular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of
                                                                                                                                                                                                                                  New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
comprising the nucleic acid and a cell comprising the recombinant vector. The polynucleotides can be used to detect the presence of E. faecalis in a sample. The sequences are useful for preparing a composition for diagnosing or treating Enterococus faecalis infection. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid comprising any one of

the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the target nor form part of the printed specification, but was obtained in the print of the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             drug activity monitoring; expression profile; gene expression; peripheral blood sample; peripheral blood mononuclear cell; drug therapy; CCI-779; immunosuppressant; rapamycin; mammalian target of rapamycin;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  28-JUN-1999
  by comparing an expression profile of at least one gene in a peripheral blood sample of a patient to a reference expression profile of the at least one gene, where the at least one gene is differentially expressed in peripheral blood monomuclear cells (PBMCs) of patients who have a nonblood disease and are subjected to a drug therapy as compared to PBMCs isolated from the patient before the drug therapy, and where the patient has the non-blood disease and is being treated by the drug therapy. The method, kit, and nucleic acid array are useful for monitoring drug activities in vivo. The drug is especially CCI-779, an ester analogue of the immunosuppressant rapamycin which is a potent inhibitor of the cammalian target of rapamycin (MTOR). This sequence represents a gene expressed in PBMC altered by the drug therapy. (Note: this sequence does no form part of the printed specification but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences/).
                                                                                                                                                                                                                                                                                                                                   114718 GATGCAAATACTGCAGGACCTGAACATCCAGGAGGCTTCACTGCTGCTTCCCAGCAAAG 114659
                                                                                                                                                                                                                                                                                                               1 GATGCTAATACTGTAGGAGTTTCAATTTCAGCAGGTATCAGAACGGCTTTACTGGTAAT 60
                                                                The invention relates to a method of monitoring drug activities in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hybridisation assay; genetic mapping; gene expression control; protein identification; signal transduction pathway; metabolic pathway;
Monitoring drug activities in vivo comprises comparing an expression profile of a gene in a peripheral blood sample of a patient before and after drug therapy.

The nucleotides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or morbid states. They are also useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers. This sequence corresponds to a nucleotide sequence of the invention.
                                                                                                                                                                                                                                                                            532

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to promotery expression of a polymothecide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant with the such as maize or soybean. The method of producing a plant with the such as maize or soybean. The method of producing a plant with the having an improved property comprises transformed plant, where the polymucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plants with the improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth requlators, increased rate of

homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polymucleotide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
11 a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid, (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid, (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid comprising any one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Zyskind JW;

                                                                                                                                                                                                                                                                                             proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids are useful for callular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, R. pneumoniae or P. aeruginosa. The present sequence is one of the target not form part of the printed specification, but was obtained in electronic format directly from WIPO at
the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "copy 2 promoter; specifically claimed in nucleic acid construct of Claim 9" 16084. .19932

```
nematode resistance, obtained from a bacterial artificial chromosome (BAC). Mi was localised by genetic analysis to a region of the tomato genome of about 65 kb. DNA corresponding to this region was cloned into BAC vectors. Sequence analysis of a 52 kb BAC3 insert identified 3 open reading frames, one of which is probably a pseudogene. By RNA blot analysis, transcripts of approximately 4 kb corresponding to copy 1 and copy 2 were found in both resistant and susceptible tomato roots and in leaves of resistant but not susceptible plants. CDNA sequences corresponding to full-length transcripts of copy 1 (see. ANV26082) and copy 2 (see AAV26083) were obtained. The encoded polypeptides (see AAW56083) are 91% identical and contain structural features similar to
                                                                                                                                                                                                                                                                                                                                                                                                                                               known plant resistance genes (R genes) of the nucleotide binding site/leucine-rich repeat (NBS/LRR) family. A recombinant expression cassette comprising an Mi polynucleotide and an operably linked plant promoter can be used to enhance nematode resistance in plants especially tomatoes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (claimed). Transgenic plants can also be constructed using a Mi promoter with heterologous genes; the Mi promoters can be used to express a variety of genes in the same temporal and spatial patterns and at similar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     6714 GGTGATAGTAATTCTGGAGTTGCAGGGTCAAAAGGGTATCAGCAGAACTTGAAA 6772
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mouse; cancer-associated protein; CAP; cancer-associated gene; CA; gene;
                                                                        Nucleic acids encoding Mi polypeptide(s) conferring nematode resistance useful to produce transgenic plants resistant to these and other pests, and in marker-aided selection to assess cultivars for resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel human cancer associated protein encoded within open reading frame of cancer associated gene, useful as targets for diagnosing cancer.
                                                                                                                                                                                                    This is the nucleotide sequence of the tomato Mi locus associated with

associated (CA) nucleic acids encoding them. The invention also relates to a method for treating cancers involving administering to a patient an inhibitor of CAP, and a method of screening for anticancer activity in a potential drug involving providing a cell that expresses a CA gene, contacting a tissue sample derived from a cancer cell with an anticancer drug candidate and monitoring the effect of the anticancer drug candidate and monitoring the RP proteins are useful for detecting cancer associated with expression of a CAP protein in a test cell sample and for screening for a bloactive agent capable of modulating the activity of a CAP protein. The CA nucleic acids are useful for diagnosing cancer, involving determining the expression of a CA nucleic acid in a tissue. This sequence represents a murine CA gene of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     7130 rgarrrrgraddagrrrcrggrcagrcagraddagragcaagccarcrrcaraggrcaccrca 7188

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN2752 encode the human ORFX proteins given in ABP00010 to ABN15705.

Treating or preventing a pathology associated with an ORFX-associated disorder. ORFX proteins are useful for clasured in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polynucleotide syndrome associated with ORFX-associated disorder. ORFX polynucleotide correctment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders can be used in the transplantation, cardiovascular diseases, disorders related to organizance of seases, hypertension, hypothyroidism, cholesterol ester curansplantation, cardiovascular diseases, disorders related to organizance diseases, autoimmune deficiencies and disorders, infectious diseases, autoimmune thyroiditis, mysthenia gravis, graft-versus-host diseases, autoimmune thyroiditis, mysthenia gravis, graft-versus-host diseases and autoimmune thyroiditis, mysthenia gravis, graft-versus-host diseases and autoimmune thyroiditis, mysthenia gravis, graft-versus-host disease and autoimmune thyroiditis, unders, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from reperfusion injury in various tissues and conditions resulting from cycokine damage. NB. The sequence data for this patent did not form with a size of the printed specification, but was obtained in electronic

Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue

Example 2; SEQ ID NO 3669; 210pp; English.

The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic scarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated bNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor. 88888888888888888

Example 3; Fig 6; 107pp; English.

deposition.

The present invention describes a method (M1) for selecting a domestic animal for having desired genotypic properties. The method comprises testing the animal for the presence of a parentally imprinted quantitative trait locus (QTL). The pig QTL is located at chromosome 2, mapping at around position 2pl.7. Also described are: (1) an isolated and/or recombinant nucleic acid (N1) comprising a parentally imprinted QTL or its functional fragment; (2) an isolated and/or recombinant nucleic acid (N2) comprising a synthetic parentally imprinted QTL or its functional fragment; (3) an animal AAA65428/C

properties; (4) a transgenic animal comprising N1 or N2; and (5) sperm or an embryo derived from the animal comprising N1 or N2; and (5) sperm or useful for selecting an animal of (3) or (4). N1 or its fragment is useful for selecting an animal of or slaughter or a breeding animal having desired genotypic or potential phenotypic properties. The properties are related to muscle mass and/or fat deposition. The sperm or an embryo are useful in breeding animals destined for slaughter. AAA65418 to AAA6554 represent contigs 1 to 10 and 19 to 115 which were isolated from porcine BAC-PIGFD-1 which contains the INS and IGF2 (insulin-like growth factor) genes. These sequences where used in an example from the present invention for generating a reference sequence of IGF2 and

The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcom the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue Example 2; SEQ ID NO 7628; 210pp; English. ватсоша

ö acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor. rrradgrrrrrrrangangargrcrracaacrarrrrccrrrrarracacrac 12 IGTAGGAGTITICAATITICAGCAGGTATCAGAACGGCTITACTGGTAATATCACTAC 68 0; Gaps DB 12; Length 596; Sequence 596 BP; 158 A; 112 C; 105 G; 221 T; 0 U; 0 Other; 20; Indels 0; Mismatches 43; Score 25; Pred. Novel human diagnostic and therapeutic polypeptide useful for identifying test compound which specifically binds to a polypeptide encoded by human diagnostic and therapeutic polynucleotide, and to induce antibodies.

Claim 2; SEQ ID NO 228; 591pp; English.

The invention relates to novel human diagnostic and therapeutic polynuclectides designated dithp (ACC46080-ACC46749) and to their encoded proteins (DITHP; ABR41136-ABR41812). The invention also relates to

cc polynucleotide sequences at least 90% identical to the dithp cDNA sequences of the invention; recombinant vectors, host cells and transgenic organisms comprising a dithp nucleic acid sequence; the recombinant production of DITHP proteins; antibodies specific for DITHP proteins; antibodies specific for DITHP proteins matcheds of exceening detecting dithp nucleotide and protein sequences, methods of assessing the toxicity of test compounds using a dithp hybridisation for compounds which specifically bind a DITHP protein; and methods of assessing the toxicity of test compounds using a dithp hybridisation probe. Dithp nucleic acid sequences and DITHP proteins may be used in the diagnosis of a wide variety of conditions including cancer and other cell proliferative disorders; autoimmune or inflammatory disorders; bacterial, viral, fungal or parasitic infections; hormonal disorders; bacterial, viral, fungal or parasitic infections; hormonal disorders; bacterial, viral, fungal or parasitic infections; promonal disorders; transport disorders; and connective tissue disorders. They may also be used to screen for modulators of protein activity or gene expression. DITHP proteins can additionally be used in analysis of the protecome of a tissue or cell type and to induce antibodies. The dithp nucleic acids are proteins can additionally useful in somatic or germline gene therapy of the disorders mentioned above, as a source of antisense sequences, as a source of probes and primers, in genotyping and identification of individuals, in toxicological testing, and in transcripting mannised animals, in toxicological testing, and in transcripting mannised animals, in toxicological testing, and in transcripting protein when the present sequence represents a dithp cDNA encoding a DITHP protein when the patent did not form part of the printing specification, but was obtained to patent did not form part of the printing specification, but was obtained in electronic format directly from WIPO at Sequence 1308 BP; 409 A; 264 C; 264 G; 371 T; 0 U; 0 Other; \$
